

Project Handover — AMW Annual Performance Evaluation System

Thank you for the opportunity to build this system. This page is a plain-language summary of **what you're receiving, what's ready, and the few things left to go fully live.**

At a glance

What it is	A web app that runs your annual employee performance reviews end-to-end
Version	v1.4.6
Where it lives	https://github.com/Madebynoppawit/Performance-evaluation-Form
Handover date	2026-06-29
Status	Ready to demo today. A short setup (server + passwords) takes it fully live.

What you're getting

A complete, ready-to-run system that lets your team:

- **Run reviews online** — goals, competencies, attendance, comments, salary, and sign-off, all in one form (tailored per job level).
- **Score fairly** — one simple **1–5 scale** everywhere, with clear rating descriptions.
- **Control who sees what** — separate access for Employees, Supervisors/Managers, Admin/HR, and Directors.
- **Calibrate and finalize** — HR can review and lock final grades before a cycle closes.
- **See the big picture** — dashboards, reports, and an audit trail for leadership.
- **Export anything** — polished PDF (Thai + English) and Excel/CSV.
- **Work in 3 languages** — Thai, English, French.
- **Load employees easily** — import the staff list from your **WinDev** export (CSV).

Is it ready?

Yes. Everything has been built, tested, and checked:

Check	Result
Automated tests (app logic + screens)	360 passed, 0 failed
Robot test that clicks through the real UI	139 passed
Automated build and security pipeline	Green (8 of 8)
Security scan — no real staff data or passwords in the code	Clean
Matches your HR form requirements	Complete

In short: **no known problems**. You can demo it with confidence.

To go fully live

These last steps need your company's server and decisions — each one is simple:

1. **Pick a server** and set up the database.
2. **Set the secret keys** (one command generates them) and the website address.
3. **Turn on auto-deploy** with one switch once the server is ready.
4. **Import your real employees** from the WinDev CSV export.
5. **Change the demo passwords** to real ones.

Step-by-step instructions are in the **Deploy Checklist** (linked below). Your technical person can follow it top to bottom.

Your data stays yours and safe

- **Real employee information is never stored in the code** — it lives only in your database.
- Staff are loaded from your **WinDev** system: export to CSV, then import on the *User / Data Management* page. Keep that CSV file private (it is real personal data).
- The system **refuses to start** in production with a weak password key or an open security setting — protecting you by default.

Where to find things

You want...	Look here
The whole system (code and history)	the GitHub link above
Demo login IDs and passwords	the file <code>backend/prisma/seed.cjs</code> (kept out of public view)
How to run and set it up	Developer & Admin Guide + Deploy Checklist (below)
Day-to-day operations and backups	Operations Runbook (below)

Keeping it healthy

- Your developer runs one command (`npm run verify`) before any change — it auto-checks everything.
- Rebuild the app images about once a month so security stays current (the setup does this for you).
- Recommended ongoing care: bug fixes, small features, and security updates (typically **15–20% of the build cost per year**).

Your team can continue the project anytime — start with the **Developer & Admin Guide**.

Sign-off

Confirmed at handover	
Full system delivered to GitHub	Yes
All tests and quality checks passing	Yes
Documentation complete	Yes
No real personal data or passwords in the code	Yes
Demo runs from a clean setup	Yes
Remaining go-live steps written down for you	Yes
